The dependency graph shown below illustrates the relationships that my Flask app "*app.py*" relies on. In the right side of the graph, you can see that *app.py* imports two custom modules: *load_data* and *query_data*. The *load_data* module defines functions used to export my data into a PostgreSQL database, while query_data defines functions that execute SQL queries to answer the 7 analysis questions from the Module 3 assignment. These two custom modules in turn rely on built-in libraries such as *json* and *datetime*. The most prominent source of dependency in my dependency graph is the Flask framework (represented by the blue squares).
